Table 3.3 Synonyms and Mineral Names	3.61

3.1 NOMENCLATURE OF INORGANIC COMPOUNDS

The following synopsis of rules for naming inorganic compounds and the examples given in explanation are not intended to cover all the possible cases. For a more comprehensive and detailed description, see G. J. Leigh (ed.), *Nomenclature of Inorganic Chemistry*, 3d ed., Blackwell Scientific Publications, Oxford, 1990. This 289-page publication contains the Recommendations 1990 of the Commission on Nomenclature of Inorganic Chemistry and was prepared under the auspices of the International Union of Pure and Applied Chemistry (IUPAC). In particular, the latest report should be consulted for coordination compounds, boron compounds, and crystalline phases of variable composition.

3.1.1 Writing Formulas

3.1.1.1 Mass Number, Atomic Number, Number of Atoms, and Ionic Charge. The mass number, atomic number, number of atoms, and ionic charge of an element are indicated by means of four indices placed around the symbol:

Ionic charge should be indicated by an Arabic superscript numeral preceding the plus or minus sign: Mg^{2+} , PO_4^{3-} .

3.1.1.2 Placement of Atoms in a Formula. The electropositive constituent (cation) is placed first in a formula. If the compound contains more than one electropositive or more than one electronegative constituent, the sequence within each class should be in alphabetical order of their symbols.

The alphabetical order may be different in formulas and names; for example, $\text{NaNH}_4\text{HPO}_4$, ammonium sodium hydrogen phosphate.

Acids are treated as hydrogen salts. Hydrogen is cited last among the cations.

When there are several types of ligands, anionic ligands are cited before the neutral ligands.

3.1.1.3 Binary Compounds between Nonmetals. For binary compounds between nonmetals, that constituent should be placed first which appears earlier in the sequence:

Examples: AsCl_3 , SbH_3 , H_3Te , BrF_3 , OF_2 , and N_4S_4 .

3.1.1.4 Chain Compounds. For chain compounds containing three or more elements, the sequence should be in accordance with the order in which the atoms are actually bound in the molecule or ion.

Examples: SCN^- (thiocyanate), HSCN (hydrogen thiocyanate or thiocyanic acid), HNCO (hydrogen isocyanate), HONC (hydrogen fulminate), and HPH_2O_2 (hydrogen phosphinate).

3.1.1.5 Use of Centered Period. A centered period is used to denote water of hydration, other solvates, and addition compounds; for example, $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, copper(II) sulfate 5-water (or pentahydrate).

3.1.1.6 Free Radicals. In the formula of a polyatomic radical an unpaired electron(s) is(are) indicated by a dot placed as a right superscript to the parentheses (or square bracket for coordination compounds). In radical ions the dot precedes the charge. In structural formulas, the dot may be placed to indicate the location of the unpaired electron(s).

Examples: $(\text{HO})^\cdot$ $(\text{O}_2)^{2\cdot}$ $(\dot{\text{N}}\text{H}_3^+)$

3.1.1.7 Enclosing Marks. Where it is necessary in an inorganic formula, enclosing marks (parentheses, braces, and brackets) are nested within square brackets as follows:

In an inorganic name the nesting order is different: $\{[\{(\text{)})\}\}$, and so on.

3.1.1.8 Molecular Formula. For compounds consisting of discrete molecules, a formula in accordance with the correct molecular weight of the compound should be used.

Examples: S_2Cl_2 , S_8 , N_2O_4 , and $\text{H}_4\text{P}_2\text{O}_6$; not SCl , S , NO_2 , and H_2PO_3 .

3.1.1.9 Structural Formula and Prefixes. In the structural formula the sequence and spatial arrangement of the atoms in a molecule are indicated.

Examples: $\text{NaO}(\text{O}=\text{C})\text{H}$ (sodium formate), $\text{Cl}-\text{S}-\text{S}-\text{Cl}$ (disulfur dichloride).

Structural prefixes should be italicized and connected with the chemical formula by a hyphen: *cis*-, *trans*-, *anti*-, *syn*-, *cyclo*-, *catena*-, *o*- or *ortho*-, *m*- or *meta*-, *p*- or *para*-, *sec*- (secondary), *tert*- (tertiary), *v*- (vicinal), *meso*-, *as*- for asymmetrical, and *s*- for symmetrical.

The sign of optical rotation is placed in parentheses, (+) for dextrorotatory, (-) for levorotatory, and (\pm) for racemic, and placed before the formula. The wavelength (in nanometers) is indicated by a right subscript; unless indicated otherwise, it refers to the sodium D-line.

The italicized symbols *d*- (for deuterium) and *t*- (for tritium) are placed after the formula and connected to it by a hyphen. The number of deuterium or tritium atoms is indicated by a subscript to the symbol.

<i>Examples:</i>	<i>cis</i> -[PtCl ₂ (NH ₃) ₂]	methan- <i>d</i> ₃ -ol
	di- <i>tert</i> -butyl sulfate	(+) ₅₈₉ [Co(en) ₃]Cl ₂
		methan-ol- <i>d</i>

3.1.2 Naming Compounds

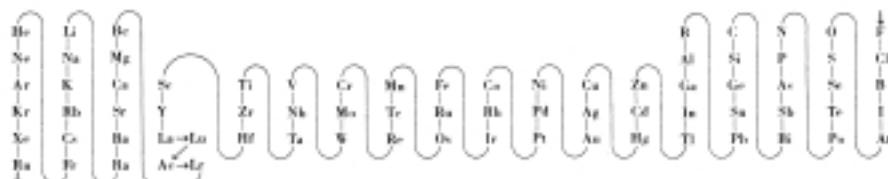

3.1.2.1 Names and Symbols for Elements. Names and symbols for the elements are given in Table 3.2. Wolfram is preferred to tungsten but the latter is used in the United States. In forming a complete name of a compound, the name of the electropositive constituent is left unmodified except when it is necessary to indicate the valency (see oxidation number and charge number, formerly the Stock and Ewens-Bassett systems). The order of citation follows the alphabetic listing of the names of the cations followed by the alphabetical listing of the anions and ligands. The alphabetical citation is maintained regardless of the number of each ligand.

Example: K[AuS(S₂)] is potassium (disulfido)thioaurate(1-).

3.1.2.2 Electronegative Constituents. The name of a monatomic electronegative constituent is obtained from the element name with its ending (-en, -ese, -ic, -ine, -ium, -ogen, -on, -orus, -um, -ur, -y, or -ygen) replaced by -ide. The elements bismuth, cobalt, nickel, zinc, and the noble gases are used unchanged with the ending -ide. Homopolyatomic ligands will carry the appropriate prefix. A few Latin names are used with affixes: cupr- (copper), aur- (gold), ferr- (iron), plumb- (lead), argent- (silver), and stann- (tin).

For binary compounds the name of the element standing later in the sequence in Sec. 3.1.1.3 is modified to end in -ide. Elements other than those in the sequence of Sec. 3.1.1.3 are taken in the reverse order of the following sequence, and the name of the element occurring last is modified to end in -ide; e.g., calcium stannide.

ELEMENT SEQUENCE

3.1.2.3 Stoichiometric Proportions. The stoichiometric proportions of the constituents in a formula may be denoted by Greek numerical prefixes: mono-, di-, tri-, tetra-, penta-, hexa-, hepta-, octa-, nona- (Latin), deca-, undeca- (Latin), dodeca-, . . . , icosa- (20), henicosa- (21), . . . , triconta- (30), tetraconta- (40), . . . , hecta- (100), and so on, preceding without a hyphen the names of the elements to which they refer. The prefix mono can usually be omitted; occasionally hemi-(½) and sesqui- (¾) are used. No elisions are made when using numerical prefixes except in the case of icosa- when the letter “i” is elided in docosa- and tricosa-. Beyond 10, prefixes may be replaced by Arabic numerals.

When it is required to indicate the number of entire groups of atoms, the multiplicative numerals bis-, tris-, tetrakis-, pentakis-, and so on, are used (i.e., -kis is added starting from tetra-). The entity to which they refer is placed in parentheses.

Examples: Ca[PF₆]₂, calcium bis(hexafluorophosphate); and (C₁₀H₂₁)₃PO₄, tris(decyl) phosphate instead of tridecyl which is (C₁₃H₂₇)₃.

Composite numeral prefixes are built up by citing units first, then tens, then hundreds, and so on. For example, 43 is written tritetraconta- (or tritetraconta-).

In indexing it may be convenient to italicize a numerical prefix at the beginning of the name and connect it to the rest of the name with a hyphen; e.g., *di*-nitrogen pentaoxide (indexed under the letter "n").

3.1.2.4 Oxidation and Charge Numbers. The *oxidation number* (Stock system) of an element is indicated by a Roman numeral placed in parentheses immediately following the name of the element. For zero, the cipher 0 is used. When used in conjunction with symbols the Roman numeral may be placed above and to the right. The *charge number* of an ion (Ewens-Bassett system) rather than the oxidation state is indicated by an Arabic numeral followed by the sign of the charge cited and is placed in parentheses immediately following the name of the ion.

Examples: P₂O₅, diphosphorus pentaoxide or phosphorus(V) oxide; Hg²⁺, mercury(I) ion or dimercury(2+) ion; K₂[Fe(CN)₆], potassium hexacyanoferrate(II) or potassium hexacyanoferate(4-); Pb^{II}Pb^{IV}O₄, dilead(II) lead(IV) oxide or trilead tetraoxide.

Where it is not feasible to define an oxidation state for each individual member of a group, the overall oxidation level of the group is defined by a formal ionic charge to avoid the use of fractional oxidation states; for example, O₂⁻.

3.1.2.5 Collective Names.

Collective names include:

Halogens (F, Cl, Br, I, At)

Chalcogens (O, S, Se, Te, Po)

Alkali metals (Li, Na, K, Rb, Cs, Fr)

Alkaline-earth metals (Ca, Sr, Ba, Ra)

Lanthanoids or lanthanides (La to Lu)

Rare-earth metals (Sc, Y, and La to Lu inclusive)

Actinoids or actinides (Ac to Lr, those whose 5f shell is being filled)

Noble gases (He to Rn)

A transition element is an element whose atom has an incomplete *d* subshell, or which gives rise to a cation or cations with an incomplete *d* subshell.

3.1.2.6 Isotopically Labeled Compounds. The hydrogen isotopes are given special names: ¹H (protium), ²H or D (deuterium), and ³H or T (tritium). The superscript designation is preferred because D and T disturb the alphabetical ordering in formulas.

Other isotopes are designated by mass numbers: ¹⁰B (boron-10).

Isotopically labeled compounds may be described by inserting the italic symbol of the isotope in brackets into the name of the compound; for example, H³⁶Cl is hydrogen chloride[³⁶Cl] or hydrogen chloride-36, and ²H³⁸Cl is hydrogen [²H] chloride[³⁸Cl] or hydrogen-2 chloride-38.

3.1.2.7 Allotropes. Systematic names for gaseous and liquid modifications of elements are sometimes needed. Allotropic modifications of an element bear the name of the atom together with the descriptor to specify the modification. The following are a few common examples:

Symbol	Trivial name	Systematic name
H	Atomic hydrogen	Monohydrogen
O ₂	(Common oxygen)	Dioxygen
O ₃	Ozone	Trixygen
P ₄	White phosphorus	Tetraphosphorus
S ₈	α -Sulfur, β -Sulfur	Octasulfur
S _n	μ -Sulfur (plastic sulfur)	Polysulfur

Trivial (customary) names are used for the amorphous modification of an element.

3.1.2.8 Heteroatomic and Other Anions. A few heteroatomic anions have names ending in -ide. These are

- | | |
|---|---|
| —OH, hydroxide ion (not hydroxyl) | —NH—, imide ion |
| —CN, cyanide ion | —NH—NH ₂ , hydrazide ion |
| —HF ₂ [−] , hydrogen difluoride ion | —NHOH, hydroxylamide ion |
| —NH ₂ , amide ion | —HS [−] , hydrogen sulfide ion |

Added to these anions are

- | | |
|--|----------------------|
| —I ₃ [−] , triiodide ion | —O—O—, peroxide ion |
| —N ₃ , azide ion | —S—S—, disulfide ion |
| —O ₃ , ozonide ion | |

3.1.2.9 Binary Compounds of Hydrogen. Binary compounds of hydrogen with the more electropositive elements are designated hydrides (NaH, sodium hydride).

Volatile hydrides, except those of Periodic Group VII and of oxygen and nitrogen, are named by citing the root name of the element (penultimate consonant and Latin affixes, Sec. 3.1.2.2) followed by the suffix -ane. Exceptions are water, ammonia, hydrazine, phosphine, arsine, stibine, and bismuthine.

Examples: B₂H₆, diborane; B₁₀H₁₄, decaborane(14); B₁₀H₁₆, decaborane(16); P₂H₄, diphosphane; Sn₂H₆, distannane; H₂Se₂, diselane; H₂Te₂, ditellane; H₂S₅, pentasulfane; and PbH₄, plumbane.

3.1.2.10 Neutral Radicals. Certain neutral radicals have special names ending in -yl:

HO	hydroxyl	ClO ₃	perchloryl*
CO	carbonyl	CrO ₂	chromyl
ClO	chlorosyl*	NO	nitrosyl
ClO ₂	chloryl*	NO ₂	nitryl (nitroyl)

* Similarly for the other halogens.

PO	phosphoryl	SeO	seleninyl
SO	sulfinyl (thionyl)	SeO ₂	selenonyl
SO ₂	sulfonyl (sulfuryl)	UO ₂	uranyl
S ₂ O ₅	disulfuryl	NpO ₂	neptunyl†

Radicals analogous to the above containing other chalcogens in place of oxygen are named by adding the prefixes thio-, seleno-, and so on; for example, PS, thiophosphoryl; CS, thiocarbonyl.

3.1.3 Cations

3.1.3.1 Monatomic Cations. Monatomic cations are named as the corresponding element; for example, Fe²⁺, iron(II) ion; Fe³⁺, iron(III) ion.

This principle also applies to polyatomic cations corresponding to radicals with special names ending in -yl (Sec. 3.1.2.10); for example, PO⁺, phosphoryl cation; NO⁺, nitrosyl cation; NO₂²⁺, nitryl cation; O₂²⁺, oxygenyl cation.

Use of the oxidation number and charge number extends the range for radicals; for example, UO₂²⁺ uranyl(VI) or uranyl(2+) cation; UO₃⁺, uranyl(V) or uranyl(1+) cation.

3.1.3.2 Polyatomic Cations. Polyatomic cations derived by addition of more protons than required to give a neutral unit to polyatomic anions are named by adding the ending -onium to the root of the name of the anion element; for example, PH₄⁺, phosphonium ion; H₂I⁺, iodonium ion; H₃O⁺, oxonium ion; CH₃OH₂⁺, methyl oxonium ion.

Exception: The name ammonium is retained for the NH₄⁺ ion; similarly for substituted ammonium ions; for example, NF₄⁺, tetrafluoroammonium ion.

Substituted ammonium ions derived from nitrogen bases with names ending in -amine receive names formed by changing -amine into -ammonium. When known by a name not ending in -amine, the cation name is formed by adding the ending -ium to the name of the base (eliding the final vowel); e.g., anilinium, hydrazinium, imidazolium, acetonium, dioxanium.

Exceptions are the names uronium and thiouronium derived from urea and thiourea, respectively.

3.1.3.3 Multiple Ions from One Base. Where more than one ion is derived from one base, the ionic charges are indicated in their names: N₂H₅⁺, hydrazinium(1+) ion; N₂H₆²⁺, hydrazinium(2+) ion.

3.1.4 Anions

See Secs. 3.1.2.2 and 3.1.2.8 for naming monatomic and certain polyatomic anions. When an organic group occurs in an inorganic compound, organic nomenclature (*q.v.*) is followed to name the organic part.

3.1.4.1 Protonated Anions. Ions such as HSO₄⁻ are recommended to be named hydrogensulfate with the two words written as one following the usual practice for polyatomic anions. However, in the *Nomenclature of Organic Chemistry*, 1979 edition, hydrogen is used as a separate word; this practice is followed in this Handbook.

† Similarly for the other actinoid elements.

3.1.4.2 Other Polyatomic Anions. Names for other polyatomic anions consist of the root name of the central atom with the ending -ate and followed by the valence of the central atom expressed by its oxidation number. Atoms and groups attached to the central atom are treated as ligands in a complex.

Examples: $[\text{Sb}(\text{OH})_6]^-$, hexahydroxoantimonate(V); $[\text{Fe}(\text{CN}_6)]^{3-}$, hexacyanoferrate(III); $[\text{Co}(\text{NO}_2)_6]^{3-}$, hexanitritocobaltate(III); $[\text{TiO}(\text{C}_2\text{O}_4)_2(\text{H}_2\text{O})_2]^{2-}$, oxobisoxalatodiaquatitanate(IV); $[\text{PCl}_6]^-$, hexachlorophosphate(V).

Exceptions to the use of the root name of the central atom are antimonate, bismuthate, carbonate, cobaltate, nickelate (or niccolate), nitrate, phosphate, tungstate (or wolframate), and zincate.

3.1.4.3 Anions of Oxygen. Oxygen is treated in the same manner as other ligands with the number of -oxo groups indicated by a suffix; for example, SO_3^{2-} , trioxosulfate.

The ending -ite, formerly used to denote a lower state of oxidation, may be retained in trivial names in these cases (note Sec. 3.1.5.3 also):

AsO_3^{3-}	arsenite	NOO_2^-	peroxonitrite
BrO^-	hypobromite	PO_3^{3-}	phosphite*
ClO^-	hypochlorite	SO_3^{2-}	sulfite
ClO_2^-	chlorite	$\text{S}_2\text{O}_5^{2-}$	disulfite
IO^-	hypiodite	$\text{S}_2\text{O}_4^{2-}$	dithionite
NO_2^-	nitrite	$\text{S}_2\text{O}_3^{2-}$	thiosulfite
N_2O_2^-	hyponitrite	SeO_3^{2-}	selenite

However, compounds known to be double oxides in the solid state are named as such; for example, Cr_2CuO_4 (actually $\text{Cr}_2\text{O}_3 \cdot \text{CuO}$) is chromium(III) copper(II) oxide (and not copper chromite).

3.1.4.4 Isopolyanions. Isopolyanions are named by indicating with numerical prefixes the number of atoms of the characteristic element. It is not necessary to give the number of oxygen atoms when the charge of the anion or the number of cations is indicated.

Examples: $\text{Ca}_3\text{Mo}_7\text{O}_{24}$, tricalcium 24-oxoheptamolybdate, may be shortened to tricalcium heptamolybdate; the anion, $\text{Mo}_7\text{O}_{24}^{6-}$, is heptamolybdate(6-); $\text{S}_2\text{O}_7^{2-}$, disulfate(2-); $\text{P}_2\text{O}_7^{4-}$, diphosphate(V)(4-).

When the characteristic element is partially or wholly present in a lower oxidation state than corresponds to its Periodic Group number, oxidation numbers are used; for example, $[\text{O}_2\text{HP}—\text{O}—\text{PO}_3\text{H}]^{2-}$, dihydrogendiphosphate(III,V)(2-).

A bridging group should be indicated by adding the Greek letter μ immediately before its names and separating this from the rest of the complex by a hyphen. The atom or atoms of the characteristic element to which the bridging atom is bonded, is indicated by numbers.

Examples: $[\text{O}_3\text{P}—\text{S}—\text{PO}_2—\text{O}—\text{PO}_3]^{5-}$, 1,2- μ -thiotriphosphate(5-) $[\text{S}_3\text{P}—\text{O}—\text{PS}_2—\text{O}—\text{PS}_3]^{5-}$, di- μ -oxo-octathiotriphosphate(5-)

* Named for esters formed from the hypothetical acid $\text{P}(\text{OH})_3$.

3.1.5 Acids

3.1.5.1 Acids and -ide Anions. Acids giving rise to the -ide anions (Sec. 3.1.2.2) should be named as hydrogen . . . -ide; for example, HCl, hydrogen chloride; HN₃, hydrogen azide.

Names such as hydrobromic acid refer to an aqueous solution, and percentages such as 48% HBr denote the weight/volume of hydrogen bromide in the solution.

3.1.5.2 Acids and -ate Anions. Acids giving rise to anions bearing names ending in -ate are treated as in Sec. 3.1.5.1; for example, H₂GeO₄, hydrogen germanate; H₄[Fe(CN)₆]⁻, hydrogen hexacyanoferrate(II).

3.1.5.3 Trivial Names. Acids given in Table 3.1 retain their trivial names due to long-established usage. Anions may be formed from these trivial names by changing -ous acid to -ite, and -ic acid to -ate. The prefix hypo- is used to denote a lower oxidation state and the prefix per- designates a higher oxidation state. The prefixes ortho- and meta- distinguish acids of differing water content; for example, H₄SiO₄ is orthosilicic acid and H₂SiO₃ is metasilicic acid. The anions would be named silicate(4-) and silicate(2-), respectively.

3.1.5.4 Peroxo- Group. When used in conjunction with the trivial names of acids, the prefix peroxy- indicates substitution of —O— by —O—O—.

3.1.5.5 Replacement of Oxygen by Other Chalcogens. Acids derived from oxoacids by replacement of oxygen by sulfur are called thioacids, and the number of replacements are given by prefixes di-, tri-, and so on. The affixes seleno- and telluro- are used analogously.

Examples: HOO—C=S, thiocarbonic acid; HSS—C=S, trithiocarbonic acid.

3.1.5.6 Ligands Other than Oxygen and Sulfur. See Sec. 3.1.7, Coordination Compounds, for acids containing ligands other than oxygen and sulfur (selenium and tellurium).

3.1.5.7 Differences between Organic and Inorganic Nomenclature. Organic nomenclature is largely built upon the scheme of substitution, that is, the replacement of hydrogen atoms by other atoms or groups. Although rare in inorganic nomenclature: NH₂Cl is called chloramine and NHCl₂ dichloroamine. Other substitutive names are fluorosulfonic acid and chlorosulfonic acid derived from HSO₃H. These and the names aminosulfonic acid (sulfamic acid), iminodisulfonic acid, and nitri lotrisulfonic acid should be replaced by the following based on the concept that these names are formed by adding hydroxyl, amide, imide, and so on, groups together with oxygen atoms to a sulfur atom:

HSO ₃ F	fluorosulfuric acid	NH(SO ₃ H) ₂	imidobis(sulfuric) acid
HSO ₃ Cl	chlorosulfuric acid	N(SO ₃ H) ₃	nitridotris(sulfuric) acid
NH ₂ SO ₃ H	aminosulfuric acid		

3.1.6 Salts and Functional Derivatives of Acids

3.1.6.1 Acid Halogenides. For acid halogenides the name is formed from the corresponding acid radical if this has a special name (Sec. 3.1.2.10); for example, NOCl, nitrosyl chloride. In other cases these compounds are named as halogenide oxides with the ligands listed alphabetically; for example, BiClO, bismuth chloride oxide; VCl₂O, vanadium(IV) dichloride oxide.

3.1.6.2 Anhydrides. Anhydrides of inorganic acids are named as oxides; for example, N₂O₅, dinitrogen pentaoxide.

TABLE 3.1 Trivial Names Retained for Acids

Alphabetically by characteristic element.

H_3AsO_4	arsenic acid	$\text{H}_4\text{P}_2\text{O}_7$	diphosphoric acid (or pyrophosphoric acid)
H_3AsO_3	arsenious acid	$\text{H}_4\text{P}_2\text{O}_8$	peroxodiphosphoric acid
H_3BO_3	orthoboric acid (or boric acid)	$(\text{HO})_2\text{OP}$	diphosphoric(IV) acid or hypophosphoric acid
HBO_2	metaboric acid	$(\text{HO})_2\text{OP}$	
HBrO_3	bromic acid	$(\text{HO})_2\text{P}—\text{O}$	diphosphoric(III,V) acid
HBrO_2	bromous acid	$(\text{HO})_2\text{P}—\text{O}$	
HBrO	hypobromous acid	H_2PHO_3	phosphonic acid
H_2CO_3	carbonic acid	$\text{H}_2\text{P}_2\text{H}_5\text{O}_5$	diphosphonic acid
HOCN	cyanic acid	$\text{H}_2\text{P}_2\text{O}_2$	phosphinic acid (formerly hypophosphorous acid)
HNCO	isocyanic acid	HReO_4	perrhenic acid
HONC	fulminic acid	H_2ReO_4	rhenic acid
HClO_4	perchloric acid	H_2SO_4	sulfuric acid
HClO_3	chloric acid	$\text{H}_2\text{S}_2\text{O}_7$	disulfuric acid
HClO_2	chlorous acid	H_2SO_5	peroxomonosulfuric acid
HClO	hypochlorous acid	$\text{H}_2\text{S}_2\text{O}_3$	thiosulfuric acid
H_2CrO_4	chromic acid	$\text{H}_2\text{S}_2\text{S}_6$	dithionic acid
$\text{H}_2\text{Cr}_2\text{O}_7$	dichromic acid	H_2SO_3	sulfurous acid
H_5IO_6	orthoperiodic acid	$\text{H}_2\text{S}_2\text{O}_5$	disulfurous acid
HIO_4	periodic acid	$\text{H}_2\text{S}_2\text{O}_2$	thiosulfurous acid
HIO_3	iodic acid	$\text{H}_2\text{S}_2\text{O}_4$	dithionous acid
HIO	hypoiодous acid	$\text{H}_2\text{S}_2\text{O}_6$ ($x = 3, 4, \dots$)	polythionic acid
HMnO_4	permanganic acid	H_2SO_2	(tri-, tetra-, . . .)
H_2MnO_4	manganic acid	$\text{HSb}(\text{OH})_6$	sulfoxyl acid
HNO_4	peroxonitric acid	H_2SeO_4	hexahydroxoantimonic acid
HNO_3	nitric acid	H_2SeO_3	selenic acid
HNO_2	nitrous acid	H_2SiO_4	selenious acid
H_2NO_2	nitroxylic acid	H_2SiO_3	orthosilicic acid
$\text{H}_2\text{N}_2\text{O}_2$	hyponitrous acid	HTcO_4	metasilicic acid
HOONO	peroxonitrous acid	H_2TeO_4	pertechnetic acid
H_3PO_4	orthophosphoric acid (or phosphoric acid)	H_6TeO_6	technetic acid
HPO_3	metaphosphoric acid		orthotelluric acid
H_3PO_5	peroxomonophosphoric acid		

3.1.6.3 Esters. Esters of inorganic acids are named as the salts; for example, $(\text{CH}_3)_2\text{SO}_4$, dimethyl sulfate. However, if it is desired to specify the constitution of the compound, the nomenclature for coordination compounds should be used.

3.1.6.4 Amides. Names for amides are derived from the names of the acid radicals (or from the names of acids by replacing acid by amide); for example, $\text{SO}_2(\text{NH}_2)_2$, sulfonyl diamide (or sulfuric diamide); $\text{NH}_2\text{SO}_3\text{H}$, sulfamidic acid (or amidosulfuric acid).

3.1.6.5 Salts. Salts containing acid hydrogen are named by adding the word hydrogen before the name of the anion (however, see Sec. 3.1.4.1), for example, KH_2PO_4 , potassium dihydrogen phosphate; NaHCO_3 , sodium hydrogen carbonate (not bicarbonate); NaHPHO_3 , sodium hydrogen phosphonate (only one acid hydrogen remaining).

Salts containing O^{2-} and HO^- anions are named oxide and hydroxide, respectively. Anions are cited in alphabetical order which may be different in formulas and names.

Examples: $\text{FeO}(\text{OH})$, iron(III) hydroxide oxide; $\text{VO}(\text{SO}_4)$, vanadium(IV) oxide sulfate.

3.1.6.6 Multiplicative Prefixes. The multiplicative prefixes bis, tris, etc., are used with certain anions for indicating stoichiometric proportions when di, tri, etc., have been preempted to designate condensed anions; for example, $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$, aluminum potassium bis(sulfate) 12-water (recall that disulfate refers to the anion $\text{S}_2\text{O}_7^{2-}$).

3.1.6.7 Crystal Structure. The structure type of crystals may be added in parentheses and in italics after the name; the latter should be in accordance with the structure. When the typename is also the mineral name of the substance itself, italics are not used.

Examples: MgTiO_3 , magnesium titanium trioxide (*ilmenite* type); FeTiO_3 , iron(II) titanium trioxide (*ilmenite*).

3.1.7 Coordination Compounds

3.1.7.1 Naming a Coordination Compound. To name a coordination compound, the names of the ligands are attached directly in front of the name of the central atom. The ligands are listed in alphabetical order regardless of the number of each and with the name of a ligand treated as a unit. Thus “diammine” is listed under “a” and “dimethylamine” under “d.” The oxidation number of the central atom is stated last by either the oxidation number or charge number.

3.1.7.2 Anionic Ligands. Whether inorganic or organic, the names for anionic ligands end in -o (eliding the final -e, if present, in the anion name). Enclosing marks are required for inorganic anionic ligands containing numerical prefixes, and for thio, seleno, and telluro analogs of oxo anions containing more than one atom.

If the coordination entity is negatively charged, the cations paired with the complex anion (with -ate ending) are listed first. If the entity is positively charged, the anions paired with the complex cation are listed immediately afterward.

The following anions do not follow the nomenclature rules:

F^-	fluoro	HO_2^-	hydrogen peroxy
Cl^-	chloro	S^{2-}	thio (only for single sulfur)
Br^-	bromo	S_2^{2-}	disulfido
I^-	iodo	HS^-	mercapto
O^{2-}	oxo	CN^-	cyno
H^-	hydrido (or hydro)	CH_2O^-	methoxy or methanolato
OH^-	hydroxo	CH_2S^-	methylthio or methanethiolato
O_2^{2-}	peroxo		

3.1.7.3 Neutral and Cationic Ligands. Neutral and cationic ligands are used without change in name and are set off with enclosing marks. Water and ammonia, as neutral ligands, are called “aqua” and “ammine,” respectively. The groups NO and CO, when linked directly to a metal atom, are called nitrosyl and carbonyl, respectively.

3.1.7.4 Attachment Points of Ligands. The different points of attachment of a ligand are denoted by adding italicized symbol(s) for the atom or atoms through which the attachment occurs at the end of the name of the ligand; e.g., glycine-*N* or glycinato-*O,N*. If the same element is involved in different possible coordination sites, the position in the chain or ring to which the element is attached is indicated by numerical superscripts: e.g., tartrato(3)- O^1,O^2 , or tartrato(4)- O^2,O^3 or tartrato(2)- O^1,O^4 .

3.1.7.5 Abbreviations for Ligand Names. Except for certain hydrocarbon radicals, for ligand (L) and metal (M), and a few with H, all abbreviations are in lowercase letters and do not involve hyphens. In formulas, the ligand abbreviation is set off with parentheses. Some common abbreviations are

Ac	acetyl	en	ethylenediamine
acac	acetylacetone	Him	imidazole
Hacac	acetylacetone	H ₂ ida	iminodiacetic acid
Hba	benzoylacetone	Me	methyl
Bzl	benzyl	H ₃ nta	nitrilotriacetic acid
Hbg	biguanide	nbd	norbornadiene
bpy	2,2'-bipyridine	ox	oxalato(2-) from parent H ₂ ox
Bu	butyl	phen	1,10-phenanthroline
Cy	cyclohexyl	Ph	phenyl
D ₂ dea	diethanolamine	pip	piperidine
dien	diethylenetriamine	Pr	propyl
dmf	dimethylformamide	pn	propylenediamine
H ₂ dmg	dimethylglyoxime	Hpz	pyrazole
dmg	dimethylglyoximate(2-)	py	pyridine
Hdmg	dimethylglyoximate(1-)	thf	tetrahydrofuran
dmso	dimethylsulfoxide	tu	thiourea
Et	ethyl	H ₃ tea	triethanolamine
H ₄ edta	ethylenediaminetetraacetic acid	tren	2,2',2"-triaminotriethylamine
Hedta, edta	coordinated ions derived from H ₄ edta	trien	triethylenetetraamine
Hea	ethanolamine	tn	trimethylenediamine
		ur	urea

Examples: Li[B(NH₂)₄], lithium tetraamidoborate(1-) or lithium tetraamidoborate(III); [Co(NH₃)₅Cl]Cl₃, pentaamminechlorocobalt(III) chloride or pentaamminechlorocobalt(2+) chloride; K₃[Fe(CN)₅CO], potassium carbonylpentacyanoferrate(II) or potassium carbonylpentacyano-ferrate(3-); [Mn{C₆H₄(O)(COO)}₂(H₂O)₄]⁻, tetraaquabis[salicylato(2-)]manganate(III) ion; [Ni(C₄H₇N₂O₂)₂] or [Ni(dmg)] which can be named bis-(2,3-butanedione dioximato)nickel(II) or bis(dimethylglyoximate(2-))nickel(II).

3.1.8 Addition Compounds

The names of addition compounds are formed by connecting the names of individual compounds by a dash (—) and indicating the numbers of molecules in the name by Arabic numerals separated by the solidus (diagonal slash). All molecules are cited in order of increasing number; those having the same number are cited in alphabetic order. However, boron compounds and water are always cited last and in that order.

Examples: 3CdSO₄ · 8H₂O, cadmium sulfate—water (3/8); Al₂(SO₄)₃ · K₂SO₄ · 24H₂O, aluminum sulfate—potassium sulfate—water (1/1/24); AlCl₃ · 4C₂H₅OH, aluminum chloride—ethanol (1/4).

3.2 PHYSICAL PROPERTIES OF PURE SUBSTANCES

TABLE 3.2 Physical Constants of Inorganic Compounds

Names follow the IUPAC Nomenclature. Solvates are listed under the entry for the anhydrous salt. Acids are entered under Hydrogen and acid salts are entered as a subentry under hydrogen.

Formula weights are based upon the International Atomic Weights of 1993 and are computed to the nearest hundredth when justified. The actual significant figures are given in the atomic weights of the individual elements.

Each element that has neither a stable isotope nor a characteristic natural isotopic composition is represented in this table by one of that element's commonly known radioisotopes identified by mass number and relative atomic mass.

Density values are given at room temperature unless otherwise indicated by the superscript figure; for example, 2.487^{15} indicates a density of 2.487 g/cm^3 for the substance at 15°C . A superscript 20 over a subscript 4 indicates a density at 20°C relative to that of water at 4°C . For gases the values are given as grams per liter (g/L).

Melting point is recorded in a certain case as 250 d and in some other cases as d 250, the distinction being made in this manner to indicate that the former is a melting point with decomposition at 250°C while in the latter decomposition only occurs at 250°C and higher temperatures. Where a value such as $-6\text{H}_2\text{O}$, 150 is given it indicates a loss of 6 moles of water per formula weight of the compound at a temperature of 150°C . For hydrates the temperature stated represents the compound melting in its water of hydration.

Boiling point is given at atmospheric pressure (760 mm of mercury or 101 325 Pa) unless otherwise indicated; thus $82^{15\text{mm}}$ indicates that the boiling point is 82°C when the pressure is 15 mm of mercury. Also, subl 550 indicates that the compound sublimes at 550°C . Occasionally decomposition products are mentioned.

Solubility is given in parts by weight (of the formula weight) per 100 parts by weight of the solvent (i.e., percent by weight) and at room temperature. Another unit frequently used is grams per 100 mL of solvent (mL per 100 mL for liquids and gases). The symbols of the common mineral acids represent aqueous solutions of these acids.

Abbreviations Used in the Table

a, acid	h, hot
abs, absolute	hex, hexagonal
abs alc, anhydrous ethanol	HOAc, acetic acid
acet, acetone	i, insoluble
alk, alkali (aq NaOH or KOH)	ign, ignites
anhyd, anhydrous	L, liter
aq, aqueous	lq, liquid
aq reg, aqua regia	MeOH, methanol
atm, atmosphere	min, mineral
BuOH, butanol	mL, milliliter
bz, benzene	org, organic
c, solid state	oxid, oxidizing
ca., approximately	PE, petroleum ether
chl, chloroform	pyr, pyridine
conc, concentrated	s, soluble
cub, cubic	satd, saturated
d, decomposes	sl, slightly
dil, dilute	soln, solution
disprop, disproportionates	solv, solvent(s)
EtOAc, ethyl acetate	subl, sublimes
eth, diethyl ether	sulf, sulfides
EtOH, 95% ethanol	tart, tartrate
expl, explodes	THF, tetrahydrofuran
fcc, face-centered cubic	v, very
fcetr, face-centered tetragonal	vac, vacuum
FP, flash point	viol, violently
fum, fuming	volat, volatilizes
fus, fusion, fuses	<, less than
g, gas, gram	>, greater than
glyc, glycerol	

TABLE 3.2 Physical Constants of Inorganic Compounds (*Continued*)

Name	Formula	Formula weight	Density	Melting point, °C	Boiling point, °C	Solubility in 100 parts solvent

Acanthite, <i>see</i> Silver sulfide	Cementite, <i>see</i> tri-Iron carbide
Alabandite, <i>see</i> Manganese sulfide	Cerargyrite, <i>see</i> Silver chloride
Alamosite, <i>see</i> Lead(II) silicate(2-)	Cerussite, <i>see</i> Lead carbonate
Altaite, <i>see</i> Lead telluride	Chalcanthite, <i>see</i> Copper(II) sulfate 5-water
Alumina, <i>see</i> Aluminum oxide	Chalcocite, <i>see</i> Copper(I) sulfide
Alundum, <i>see</i> Aluminum oxide	Chalk, <i>see</i> Calcium carbonate
Alunogenite, <i>see</i> Aluminum sulfate 18-water	Chile nitre, <i>see</i> Sodium nitrate
Amphibole, <i>see</i> Magnesium silicate(2-)	Chile saltpeter, <i>see</i> Sodium nitrate
Andalusite, <i>see</i> Aluminum silicon oxide (1/1)	Chloromagnesite, <i>see</i> Magnesium chloride
Angleite, <i>see</i> Lead sulfate	Chlorosulfonic acid, <i>see</i> Hydrogen chlorosulfate
Anhydrite, <i>see</i> Calcium sulfate	Cinnabar, <i>see</i> Mercury(II) sulfide
Anhydrene, <i>see</i> Magnesium perchlorate	Claudetite, <i>see</i> Arsenic(III) oxide dimer
Aragonite, <i>see</i> Calcium carbonate	Clausthalite, <i>see</i> Lead selenide
Arcanite, <i>see</i> Potassium sulfate	Clinoenstatite, <i>see</i> Magnesium silicate(2-)
Argentite, <i>see</i> Silver sulfide	Columbium, <i>see</i> under Niobium
Argol, <i>see</i> Potassium hydrogen tartrate	Corrosive sublimate, <i>see</i> Mercury(II) chloride
Arkansite, <i>see</i> Titanium(IV) oxide	Corundum, <i>see</i> Aluminum oxide
Arsenolite, <i>see</i> Arsenic(III) oxide dimer	Cotunite, <i>see</i> Lead chloride
Arsine, <i>see</i> Arsenic hydride	Covellite, <i>see</i> Copper(II) sulfide
Auric and aurous, <i>see</i> under Gold	Cream of tartar, <i>see</i> Potassium hydrogen tartrate
Azoinimide, <i>see</i> Hydrogen azide	Crococite, <i>see</i> Lead chromate(VI)(2-)
Azurite, <i>see</i> Copper(II) carbonate—dihydroxide (2/1)	Cryolite, <i>see</i> Sodium hexafluoroaluminate
Baddeleyite, <i>see</i> Zirconium(IV) oxide	Cryptohalite, <i>see</i> Ammonium hexafluorosilicate
Baking soda, <i>see</i> Sodium hydrogen carbonate	Cupric and cuprous, <i>see</i> under Copper
Barite (barytes), <i>see</i> Barium sulfate	Cuprite, <i>see</i> Copper(I) oxide
Bieberite, <i>see</i> Cobalt sulfate 7-water	Dakin's solution, <i>see</i> Sodium hypochlorite
Bismuthine, <i>see</i> Bismuth hydride	Dehydrate, <i>see</i> Magnesium perchlorate
Bismuthinite, <i>see</i> Bismuth sulfide	Dental gas, <i>see</i> Nitrogen(I) oxide
Bleaching powder, <i>see</i> Calcium hydrochlorite	Diamond, <i>see</i> Carbon
Bleaching solution, <i>see</i> Sodium hydrochlorite	Dichlorodisulfane, <i>see</i> di-Sulfur dichloride
Blue copperas, <i>see</i> Copper(II) sulfate 7-water	Diuretic salt, <i>see</i> Potassium acetate
Boracic acid, <i>see</i> Hydrogen borate	Dolomite, <i>see</i> Calcium magnesium carbonate (1/1)
Borax, <i>see</i> Sodium tetraborate 10-water	Dry ice, <i>see</i> Carbon dioxide (solid)
Braunite, <i>see</i> Manganese(III) oxide	Enstatite, <i>see</i> Magnesium silicate(2-)
Brimstone, <i>see</i> Sulfur	Epsom salts, <i>see</i> Magnesium sulfate 7-water
Bromellite, <i>see</i> Beryllium oxide	Epsomite, <i>see</i> Magnesium sulfate 7-water
Bromosulfonic acid, <i>see</i> Hydrogen bromosulfate	Eriochalcite, <i>see</i> Copper(II) chloride
Bromyrite, <i>see</i> Silver bromide	Fayalite, <i>see</i> Iron(II) silicate(4-)
Brookite, <i>see</i> Titanium(IV) oxide	Ferric and ferrous, <i>see</i> under Iron
Brucite, <i>see</i> Magnesium hydroxide	Fluorine oxide, <i>see</i> Oxygen difluoride
Bunsenite, <i>see</i> Nickel oxide	Fluoristan, <i>see</i> Tin(II) fluoride
Cacodylate, <i>see</i> Sodium dimethylarsonate 3-water	Fluorite, <i>see</i> Calcium fluoride
Caesium, <i>see</i> under Cesium	Fluorosulfonic acid, <i>see</i> Hydrogen fluorosulfate
Calamine, <i>see</i> Zinc carbonate	Fluorspar, <i>see</i> Calcium fluoride
Calcia, <i>see</i> Calcium oxide	Forsterite, <i>see</i> Magnesium silicate(4-)
Calcite, <i>see</i> Calcium carbonate	Freezing salt, <i>see</i> Sodium chloride
Calomel, <i>see</i> Mercury(I) chloride	Fulminating mercury, <i>see</i> Mercury fulminate
Caro's acid, <i>see</i> Hydrogen peroxosulfate	Galena, <i>see</i> Lead sulfite
Cassiopeium, <i>see</i> Lutetium	Glauber's salt, <i>see</i> Sodium sulfate 10-water
Cassiterite, <i>see</i> Tin(IV) oxide	Goethite, <i>see</i> Iron(II) hydroxide oxide
Caustic potash, <i>see</i> Potassium hydroxide	Goslarite, <i>see</i> Zinc sulfate 7-water
Caustic soda, <i>see</i> Sodium hydroxide	Graham's salt, <i>see</i> Sodium phosphate(1-)
Celestite, <i>see</i> Strontium sulfate	Graphite, <i>see</i> Carbon

TABLE 3.3 Synonyms and Mineral Names (*Continued*)

Greenockite, <i>see</i> Cadmium sulfide	Moissanite, <i>see</i> Silicon carbide
Gruenerite, <i>see</i> Iron(II) silicate(2-)	Molybdenite, <i>see</i> Molybdenum disulfide
Guanajuatite, <i>see</i> Bismuth selenide	Molybdite, <i>see</i> Molybdenum(VI) oxide
Gypsum, <i>see</i> Calcium sulfate 2-water	Molysite, <i>see</i> Iron(III) chloride
Halite, <i>see</i> Sodium chloride	Montroydite, <i>see</i> Mercury(II) oxide
Hausmannite, <i>see</i> Manganese(II,IV) oxide	Morenosite, <i>see</i> Nickel sulfate 7-water
Heavy hydrogen, <i>see</i> Hydrogen[² H] or name followed by -d	Mosaic gold, <i>see</i> Tin disulfide
Heavy water, <i>see</i> Hydrogen[² H] oxide	Muriatic acid, <i>see</i> Hydrogen chloride, aqueous solutions
Heazlewoodite, <i>see</i> tri-Nickel disulfide	Nantokite, <i>see</i> Copper(I) chloride
Hematite, <i>see</i> Iron(III) oxide	Natron, <i>see</i> Sodium carbonate
Hermannite, <i>see</i> Manganese silicate	Naumannite, <i>see</i> Silver selenide
Hessite, <i>see</i> Silver telluride	Neutral verdigris, <i>see</i> Copper(II) acetate
Hieratite, <i>see</i> Potassium hexafluorosilicate	Nitro (niter), <i>see</i> Potassium nitrate
Hydroazoic acid, <i>see</i> Hydrogen azide	Nitric oxide, <i>see</i> Nitrogen(II) oxide
Hydrophilite, <i>see</i> Calcium chloride	Nitrobarite, <i>see</i> Barium nitrate
Hydrosulfite, <i>see</i> Sodium dithionate(III)	Nitromagnesite, <i>see</i> Magnesium nitrate 6-water
Hypo (photographic), <i>see</i> Sodium thiosulfate 5-water	Nitroprusside, <i>see</i> Sodium pentacyanotriosylferrate(II) 2-water
Hypophosphite, <i>see</i> under Phosphinate	Oldhamite, <i>see</i> Calcium sulfide
Ice, <i>see</i> Hydrogen oxide (solid)	Opal, <i>see</i> Silicon dioxide
Iceland spar, <i>see</i> Calcium carbonate	Orpiment, <i>see</i> Arsenic trisulfide
Iodyrite, <i>see</i> Silver iodide	Oxygen powder, <i>see</i> Sodium peroxide
Jeweler's borax, <i>see</i> Sodium tetraborate 10-water	Paris green, <i>see</i> Copper acetate arsenate(III) (1/3)
Jeweler's rouge, <i>see</i> Iron(III) oxide	Pawellite, <i>see</i> Calcium molybdate(VI)(2-)
Kalinite, <i>see</i> Aluminum potassium bis(sulfate)	Pearl ash, <i>see</i> Potassium carbonate
Kernite, <i>see</i> Sodium tetraborate	Perborax, <i>see</i> Sodium peroxoborate
Kyanite, <i>see</i> Aluminum silicon oxide (1/1)	Periclase, <i>see</i> Magnesium oxide
Laughing gas, <i>see</i> Nitrogen(I) oxide	Persulfate, <i>see</i> Peroxodisulfate
Lautarite, <i>see</i> Calcium iodate	Phosgene, <i>see</i> Carbonyl chloride
Lawrencite, <i>see</i> Iron(II) chloride	Phosphine, <i>see</i> Hydrogen phosphide
Lechatelierite, <i>see</i> Silicon dioxide	Pickling acid, <i>see</i> Hydrogen sulfate
Lime, <i>see</i> Calcium oxide	Pitchblende, <i>see</i> Uranium(IV) oxide
Litharge, <i>see</i> Lead(II) oxide	Plaster of Paris, <i>see</i> Calcium sulfate hemihydrate
Lithium aluminum hydride, <i>see</i> Lithium tetrahydridoaluminate	Plattnerite, <i>see</i> Lead(IV) oxide
Lodestone, <i>see</i> Iron(II,III) oxide	Polianite, <i>see</i> Manganese(IV) oxide
Lunar caustic, <i>see</i> Silver nitrate	Polishing powder, <i>see</i> Silicon dioxide
Lye, <i>see</i> Sodium hydroxide	Potash, <i>see</i> Potassium carbonate
Magnesia, <i>see</i> Magnesium oxide	Potassium acid phthalate, <i>see</i> Potassium hydrogen phthalate
Magnesite, <i>see</i> Magnesium carbonate	Prussic acid, <i>see</i> Hydrogen cyanide
Magnetite, <i>see</i> Iron(II,III) oxide	Pyrite, <i>see</i> Iron disulfide
Malachite, <i>see</i> Copper carbonate dihydroxide	Pyrochroite, <i>see</i> Manganese(II) hydroxide
Manganosite, <i>see</i> Manganese(II) oxide	Pyrohypophosphate, <i>see</i> Diphosphate(IV)
Marcasite, <i>see</i> Iron disulfide	Pyrolusite, <i>see</i> Manganese(IV) oxide
Marshite, <i>see</i> Copper(I) iodide	Pyrophanite, <i>see</i> Manganese titanate(IV)(2-)
Mascagnite, <i>see</i> Ammonium sulfate	Pyrophosphate, <i>see</i> Diphosphate(V)
Massicotite, <i>see</i> Lead oxide	Pyrosulfuric acid, <i>see</i> Hydrogen disulfate
Mercuric and mercurous, <i>see</i> under Mercury	Quartz, <i>see</i> Silicon dioxide
Metacinnabar, <i>see</i> Mercury(II) sulfide	Quicksilver, <i>see</i> Mercury
Millerite, <i>see</i> Nickel sulfide	Realgar, <i>see</i> di-Arsenic disulfide
Mirabilite, <i>see</i> Sodium sulfate	Red lead, <i>see</i> Lead(II,IV) oxide
Mohr's salt, <i>see</i> Ammonium iron(II) sulfate 6-water	Rhodochrosite, <i>see</i> Manganese carbonate

Rock crystal, <i>see</i> Silicon dioxide	Tarapacite, <i>see</i> Potassium chromate(VI)
Rutile, <i>see</i> Titanium(IV) oxide	Tellurite, <i>see</i> Tellurium dioxide
Sal soda, <i>see</i> Sodium carbonate 10-water	Tenorite, <i>see</i> Copper(II) oxide
Saltpeter, <i>see</i> Potassium nitrate	Tephroite, <i>see</i> Manganese silicate(1-)
Scacchite, <i>see</i> Manganese chloride	Thenardite, <i>see</i> Sodium sulfate
Scheelite, <i>see</i> Calcium tungstate(VI)(2-)	Thionyl, <i>see</i> Sulfinyl
Sellaite, <i>see</i> Magnesium fluoride	Thorianite, <i>see</i> Thorium dioxide
Senarmontite, <i>see</i> Antimony(III) oxide	Topaz, <i>see</i> Aluminum hexafluorosilicate
Siderite, <i>see</i> Iron(II) carbonate	Tridymite, <i>see</i> Silicon dioxide
Siderotil, <i>see</i> Iron(II) sulfate 5-water	Troilite, <i>see</i> Iron(II) sulfide
Silica, <i>see</i> Silicon dioxide	Trona, <i>see</i> Sodium carbonate—hydrogen carbonate dihydrate
Silicotungstic acid, <i>see</i> Silicon oxide—tungsten oxide—water (1/12/26)	Tschermigite, <i>see</i> Aluminum ammonium bis(sulfate)
Sillimanite, <i>see</i> Aluminum silicon oxide (1/1)	Tungstenite, <i>see</i> Tungsten disulfide
Smithsonite, <i>see</i> Zinc carbonate	Tungstite, <i>see</i> Hydrogen tungstate
Soda ash, <i>see</i> Sodium carbonate	Uraninite, <i>see</i> Uranium(IV) oxide
Spelter, <i>see</i> Zinc metal	Valentinite, <i>see</i> Antimony(III) oxide
Sphalerite, <i>see</i> Zinc sulfide	Verdigris, <i>see</i> Copper acetate hydrate
Spherocobaltite, <i>see</i> Cobalt(II) carbonate	Vermillion, <i>see</i> Mercury(II) sulfide
Spinel, <i>see</i> Magnesium aluminate(2-)	Villiaumite, <i>see</i> Sodium fluoride
Stannic and stannous, <i>see</i> under Tin	Vitamin B ₃ , <i>see</i> Calcium (+)pantothenate
Stibine, <i>see</i> Antimony hydride	Washing soda, <i>see</i> Sodium carbonate 10-water
Stibnite, <i>see</i> Antimony(III) sulfide	Whitlockite, <i>see</i> Calcium phosphate
Stolzite, <i>see</i> Lead tungstate(VI)(2-)	Willemite, <i>see</i> Zinc silicate(4-)
Strengite, <i>see</i> Iron(III) phosphate	Wolfram, <i>see</i> Tungsten
Strontianite, <i>see</i> Strontium carbonate	Wuestite, <i>see</i> Iron(II) oxide
Sugar of lead, <i>see</i> Lead acetate	Wulfenite, <i>see</i> Lead molybdate(VI)(2-)
Sulfamate, <i>see</i> Amidosulfate	Wurtzite, <i>see</i> Zinc sulfide
Sulphate, <i>see</i> Sulfate	Zincite, <i>see</i> Zinc oxide
Sulfurated lime, <i>see</i> Calcium sulfide	Zincosite, <i>see</i> Zinc sulfate
Sulfuretted hydrogen, <i>see</i> Hydrogen sulfide	Zincspar, <i>see</i> Zinc carbonate
Sulphur, <i>see</i> Sulfur	Zirconia, <i>see</i> Zirconium oxide
Sulfuryl, <i>see</i> Sulfonyl	
Sycoporate, <i>see</i> Cobalt sulfide
