Feynman's Preface

These are the lectures in physics that I gave last year and the year before to the freshman and sophomore classes at Caltech. The lectures are, of course, not verbatim—they have been edited, sometimes extensively and sometimes less so. The lectures form only part of the complete course. The whole group of 180 students gathered in a big lecture room twice a week to hear these lectures and then they broke up into small groups of 15 to 20 students in recitation sections under the guidance of a teaching assistant. In addition, there was a laboratory session once a week.

The special problem we tried to get at with these lectures was to maintain the interest of the very enthusiastic and rather smart students coming out of the high schools and into Caltech. They have heard a lot about how interesting and exciting physics is—the theory of relativity, quantum mechanics, and other modern ideas. By the end of two years of our previous course, many would be very discouraged because there were really very few grand, new, modern ideas presented to them. They were made to study inclined planes, electrostatics, and so forth, and after two years it was quite stultifying. The problem was whether or not we could make a course which would save the more advanced and excited student by maintaining his enthusiasm.

The lectures here are not in any way meant to be a survey course, but are very serious. I thought to address them to the most intelligent in the class and to make sure, if possible, that even the most intelligent student was unable to completely encompass everything that was in the lectures—by putting in suggestions of applications of the ideas and concepts in various directions outside the main line of attack. For this reason, though, I tried very hard to make all the statements as accurate as possible, to point out in every case where the equations and ideas fitted into the body of physics, and how—when they learned more—things would be modified. I also felt that for such students it is important to indicate what it is that they should—if they are sufficiently clever—be able to understand by deduction from what has been said before, and what is being put in as something new. When new ideas came in, I would try either to deduce them if they were deducible, or to explain that it *was* a new idea which hadn't any basis in terms of things they had already learned and which was not supposed to be provable—but was just added in.

At the start of these lectures, I assumed that the students knew something when they came out of high school—such things as geometrical optics, simple chemistry ideas, and so on. I also didn't see that there was any reason to make the lectures

in a definite order, in the sense that I would not be allowed to mention something until I was ready to discuss it in detail. There was a great deal of mention of things to come, without complete discussions. These more complete discussions would come later when the preparation became more advanced. Examples are the discussions of inductance, and of energy levels, which are at first brought in in a very qualitative way and are later developed more completely.

At the same time that I was aiming at the more active student, I also wanted to take care of the fellow for whom the extra fireworks and side applications are merely disquieting and who cannot be expected to learn most of the material in the lecture at all. For such students I wanted there to be at least a central core or backbone of material which he *could* get. Even if he didn't understand everything in a lecture, I hoped he wouldn't get nervous. I didn't expect him to understand everything, but only the central and most direct features. It takes, of course, a certain intelligence on his part to see which are the central theorems and central ideas, and which are the more advanced side issues and applications which he may understand only in later years.

In giving these lectures there was one serious difficulty: in the way the course was given, there wasn't any feedback from the students to the lecturer to indicate how well the lectures were going over. This is indeed a very serious difficulty, and I don't know how good the lectures really are. The whole thing was essentially an experiment. And if I did it again I wouldn't do it the same way—I hope I *don't* have to do it again! I think, though, that things worked out—so far as the physics is concerned—quite satisfactorily in the first year.

In the second year I was not so satisfied. In the first part of the course, dealing with electricity and magnetism, I couldn't think of any really unique or different way of doing it—of any way that would be particularly more exciting than the usual way of presenting it. So I don't think I did very much in the lectures on electricity and magnetism. At the end of the second year I had originally intended to go on, after the electricity and magnetism, by giving some more lectures on the properties of materials, but mainly to take up things like fundamental modes, solutions of the diffusion equation, vibrating systems, orthogonal functions, . . . developing the first stages of what are usually called “the mathematical methods of physics.” In retrospect, I think that if I were doing it again I would go back to that original idea. But since it was not planned that I would be giving these lectures again, it was suggested that it might be a good idea to try to give an introduction to the quantum mechanics—what you will find in Volume III.

It is perfectly clear that students who will major in physics can wait until their third year for quantum mechanics. On the other hand, the argument was made that many of the students in our course study physics as a background for their primary interest in other fields. And the usual way of dealing with quantum mechanics makes that subject almost unavailable for the great majority of students because they have to take so long to learn it. Yet, in its real applications—especially in its more complex applications, such as in electrical engineering and chemistry—the full machinery of the differential equation approach is not actually used. So I tried to describe the principles of quantum mechanics in a way which wouldn't require that one first know the mathematics of partial differential equations. Even for a physicist I think that is an interesting thing to try to do—to present quantum mechanics in this reverse fashion—for several reasons which may be apparent in the lectures themselves. However, I think that the experiment in the quantum mechanics part was not completely successful—in large part because I really did not have enough time at the end (I should, for instance, have had three or four more lectures in order to deal more completely with such matters as energy bands and the spatial dependence of amplitudes). Also, I had never presented the subject this way before, so the lack of feedback was particularly serious. I now believe the quantum mechanics should be given at a later time. Maybe I'll have a chance to do it again someday. Then I'll do it right.

The reason there are no lectures on how to solve problems is because there were recitation sections. Although I did put in three lectures in the first year on how to solve problems, they are not included here. Also there was a lecture on inertial

guidance which certainly belongs after the lecture on rotating systems, but which was, unfortunately, omitted. The fifth and sixth lectures are actually due to Matthew Sands, as I was out of town.

The question, of course, is how well this experiment has succeeded. My own point of view—which, however, does not seem to be shared by most of the people who worked with the students—is pessimistic. I don't think I did very well by the students. When I look at the way the majority of the students handled the problems on the examinations, I think that the system is a failure. Of course, my friends point out to me that there were one or two dozen students who—very surprisingly—understood almost everything in all of the lectures, and who were quite active in working with the material and worrying about the many points in an excited and interested way. These people have now, I believe, a first-rate background in physics—and they are, after all, the ones I was trying to get at. But then, “The power of instruction is seldom of much efficacy except in those happy dispositions where it is almost superfluous.” (Gibbons)

Still, I didn't want to leave any student completely behind, as perhaps I did. I think one way we could help the students more would be by putting more hard work into developing a set of problems which would elucidate some of the ideas in the lectures. Problems give a good opportunity to fill out the material of the lectures and make more realistic, more complete, and more settled in the mind the ideas that have been exposed.

I think, however, that there isn't any solution to this problem of education other than to realize that the best teaching can be done only when there is a direct individual relationship between a student and a good teacher—a situation in which the student discusses the ideas, thinks about the things, and talks about the things. It's impossible to learn very much by simply sitting in a lecture, or even by simply doing problems that are assigned. But in our modern times we have so many students to teach that we have to try to find some substitute for the ideal. Perhaps my lectures can make some contribution. Perhaps in some small place where there are individual teachers and students, they may get some inspiration or some ideas from the lectures. Perhaps they will have fun thinking them through—or going on to develop some of the ideas further.

RICHARD P. FEYNMAN

June, 1963

Foreword

For some forty years Richard P. Feynman focussed his curiosity on the mysterious workings of the physical world, and bent his intellect to searching out the order in its chaos. Now, he has given two years of his ability and his energy to his Lectures on Physics for beginning students. For them he has distilled the essence of his knowledge, and has created in terms they can hope to grasp a picture of the physicist's universe. To his lectures he has brought the brilliance and clarity of his thought, the originality and vitality of his approach, and the contagious enthusiasm of his delivery. It was a joy to behold.

The first year's lectures formed the basis for the first volume of this set of books. We have tried in this the second volume to make some kind of a record of a part of the second year's lectures—which were given to the sophomore class during the 1962–1963 academic year. The rest of the second year's lectures will make up Volume III.

Of the second year of lectures, the first two-thirds were devoted to a fairly complete treatment of the physics of electricity and magnetism. Its presentation was intended to serve a dual purpose. We hoped, first, to give the students a complete view of one of the great chapters of physics—from the early gropings of Franklin, through the great synthesis of Maxwell, on to the Lorentz electron theory of material properties, and ending with the still unsolved dilemmas of the electromagnetic self-energy. And we hoped, second, by introducing at the outset the calculus of vector fields, to give a solid introduction to the mathematics of field theories. To emphasize the general utility of the mathematical methods, related subjects from other parts of physics were sometimes analyzed together with their electric counterparts. We continually tried to drive home the generality of the mathematics. (“The same equations have the same solutions.”) And we emphasized this point by the kinds of exercises and examinations we gave with the course.

Following the electromagnetism there are two chapters each on elasticity and fluid flow. In the first chapter of each pair, the elementary and practical aspects are treated. The second chapter on each subject attempts to give an overview of the whole complex range of phenomena which the subject can lead to. These four chapters can well be omitted without serious loss, since they are not at all a necessary preparation for Volume III.

The last quarter, approximately, of the second year was dedicated to an introduction to quantum mechanics. This material has been put into the third volume.

In this record of the Feynman Lectures we wished to do more than provide a transcription of what was said. We hoped to make the written version as clear an exposition as possible of the ideas on which the original lectures were based. For some of the lectures this could be done by making only minor adjustments of the wording in the original transcript. For others of the lectures a major reworking and rearrangement of the material was required. Sometimes we felt we should add some new material to improve the clarity or balance of the presentation. Throughout the process we benefitted from the continual help and advice of Professor Feynman.

The translation of over 1,000,000 spoken words into a coherent text on a tight schedule is a formidable task, particularly when it is accompanied by the

other onerous burdens which come with the introduction of a new course—preparing for recitation sections, and meeting students, designing exercises and examinations, and grading them, and so on. Many hands—and heads—were involved. In some instances we have, I believe, been able to render a faithful image—or a tenderly retouched portrait—of the original Feynman. In other instances we have fallen far short of this ideal. Our successes are owed to all those who helped. The failures, we regret.

As explained in detail in the Foreword to Volume I, these lectures were but one aspect of a program initiated and supervised by the Physics Course Revision Committee (R. B. Leighton, Chairman, H. V. Neher, and M. Sands) at the California Institute of Technology, and supported financially by the Ford Foundation. In addition, the following people helped with one aspect or another of the preparation of textual material for this second volume: T. K. Caughey, M. L. Clayton, J. B. Curcio, J. B. Hartle, T. W. H. Harvey, M. H. Israel, W. J. Karzas, R. W. Kavanagh, R. B. Leighton, J. Mathews, M. S. Plesset, F. L. Warren, W. Whaling, C. H. Wilts, and B. Zimmerman. Others contributed indirectly through their work on the course: J. Blue, G. F. Chapline, M. J. Clauser, R. Dolen, H. H. Hill, and A. M. Title. Professor Gerry Neugebauer contributed in all aspects of our task with a diligence and devotion far beyond the dictates of duty.

The story of physics you find here would, however, not have been, except for the extraordinary ability and industry of Richard P. Feynman.

MATTHEW SANDS

March, 1964

Contents

CHAPTER 1. ELECTROMAGNETISM

- 1-1 Electrical forces 1-1
- 1-2 Electric and magnetic fields 1-3
- 1-3 Characteristics of vector fields 1-4
- 1-4 The laws of electromagnetism 1-5
- 1-5 What are the fields? 1-9
- 1-6 Electromagnetism in science and technology 1-10

CHAPTER 2. DIFFERENTIAL CALCULUS OF VECTOR FIELDS

- 2-1 Understanding physics 2-1
- 2-2 Scalar and vector fields— T and h 2-2
- 2-3 Derivatives of fields—the gradient 2-4
- 2-4 The operator ∇ 2-6
- 2-5 Operations with ∇ 2-7
- 2-6 The differential equation of heat flow 2-8
- 2-7 Second derivatives of vector fields 2-9
- 2-8 Pitfalls 2-11

CHAPTER 3. VECTOR INTEGRAL CALCULUS

- 3-1 Vector integrals; the line integral of $\nabla\psi$ 3-1
- 3-2 The flux of a vector field 3-2
- 3-3 The flux from a cube; Gauss' theorem 3-4
- 3-4 Heat conduction; the diffusion equation 3-6
- 3-5 The circulation of a vector field 3-8
- 3-6 The circulation around a square; Stokes' theorem 3-9
- 3-7 Curl-free and divergence-free fields 3-10
- 3-8 Summary 3-11

CHAPTER 4. ELECTROSTATICS

- 4-1 Statics 4-1
- 4-2 Coulomb's law; superposition 4-2
- 4-3 Electric potential 4-4
- 4-4 $E = -\nabla\phi$ 4-6
- 4-5 The flux of E 4-7
- 4-6 Gauss' law; divergence of E 4-9
- 4-7 Field of a sphere of charge 4-10
- 4-8 Field lines; equipotential surfaces 4-11

CHAPTER 5. APPLICATION OF GAUSS' LAW

- 5-1 Electrostatics is Gauss's law plus . . . 5-1
- 5-2 Equilibrium in an electrostatic field 5-1
- 5-3 Equilibrium with conductors 5-2
- 5-4 Stability of atoms 5-3
- 5-5 The field of a line charge 5-3
- 5-6 A sheet of charge; two sheets 5-4
- 5-7 A sphere of charge; a spherical shell 5-4
- 5-8 Is the field of a point charge exactly $1/r^2$? 5-5
- 5-9 The fields of a conductor 5-7
- 5-10 The field in a cavity of a conductor 5-8

CHAPTER 6. THE ELECTRIC FIELD IN VARIOUS CIRCUMSTANCES

- 6-1 Equations of the electrostatic potential 6-1
- 6-2 The electric dipole 6-2
- 6-3 Remarks on vector equations 6-4
- 6-4 The dipole potential as a gradient 6-4
- 6-5 The dipole approximation for an arbitrary distribution 6-6
- 6-6 The fields of charged conductors 6-8
- 6-7 The method of images 6-8
- 6-8 A point charge near a conducting plane 6-9
- 6-9 A point charge near a conducting sphere 6-10
- 6-10 Condensers; parallel plates 6-11
- 6-11 High-voltage breakdown 6-13
- 6-12 The field-emission microscope 6-14

CHAPTER 7. THE ELECTRIC FIELD IN VARIOUS CIRCUMSTANCES (Continued)

- 7-1 Methods for finding the electrostatic field 7-1
- 7-2 Two-dimensional fields; functions of the complex variable 7-2
- 7-3 Plasma oscillations 7-5
- 7-4 Colloidal particles in an electrolyte 7-8
- 7-5 The electrostatic field of a grid 7-10

CHAPTER 8. ELECTROSTATIC ENERGY

- 8-1 The electrostatic energy of charges. A uniform sphere 8-1
- 8-2 The energy of a condenser. Forces on charged conductors 8-2
- 8-3 The electrostatic energy of an ionic crystal 8-4
- 8-4 Electrostatic energy in nuclei 8-6
- 8-5 Energy in the electrostatic field 8-9
- 8-6 The energy of a point charge 8-12

CHAPTER 9. ELECTRICITY IN THE ATMOSPHERE

- 9-1 The electric potential gradient of the atmosphere 9-1
- 9-2 Electric currents in the atmosphere 9-2
- 9-3 Origin of the atmospheric currents 9-4
- 9-4 Thunderstorms 9-5
- 9-5 The mechanism of charge separation 9-7
- 9-6 Lightning 9-10

CHAPTER 10. DIELECTRICS

- 10-1 The dielectric constant 10-1
- 10-2 The polarization vector P 10-2
- 10-3 Polarization charges 10-3
- 10-4 The electrostatic equations with dielectrics 10-6
- 10-5 Fields and forces with dielectrics 10-7

CHAPTER 11. INSIDE DIELECTRICS

- 11-1 Molecular dipoles 11-1
- 11-2 Electronic polarization 11-1
- 11-3 Polar molecules; orientation polarization 11-3
- 11-4 Electric fields in cavities of a dielectric 11-5
- 11-5 The dielectric constant of liquids; the Clausius-Mossotti equation 11-6
- 11-6 Solid dielectrics 11-8
- 11-7 Ferroelectricity; BaTiO₃ 11-8

CHAPTER 12. ELECTROSTATIC ANALOGS

- 12-1 The same equations have the same solutions 12-1
- 12-2 The flow of heat; a point source near an infinite plane boundary 12-2
- 12-3 The stretched membrane 12-5
- 12-4 The diffusion of neutrons; a uniform spherical source in a homogeneous medium 12-6
- 12-5 Irrotational fluid flow; the flow past a sphere 12-8
- 12-6 Illumination; the uniform lighting of a plane 12-10
- 12-7 The "underlying unity" of nature 12-12

CHAPTER 13. MAGNETOSTATICS

- 13-1 The magnetic field 13-1
- 13-2 Electric current; the conservation of charge 13-1
- 13-3 The magnetic force on a current 13-2
- 13-4 The magnetic field of steady currents; Ampere's law 13-3
- 13-5 The magnetic field of a straight wire and of a solenoid; atomic currents 13-5
- 13-6 The relativity of magnetic and electric fields 13-6
- 13-7 The transformation of currents and charges 13-11
- 13-8 Superposition; the right-hand rule 13-11

CHAPTER 14. THE MAGNETIC FIELD IN VARIOUS SITUATIONS

- 14-1 The vector potential 14-1
- 14-2 The vector potential of known currents 14-3
- 14-3 A straight wire 14-4
- 14-4 A long solenoid 14-5
- 14-5 The field of a small loop; the magnetic dipole 14-7
- 14-6 The vector potential of a circuit 14-8
- 14-7 The law of Biot and Savart 14-9

CHAPTER 15. THE VECTOR POTENTIAL

- 15-1 The forces on a current loop; energy of a dipole 15-1
- 15-2 Mechanical and electrical energies 15-3
- 15-3 The energy of steady currents 15-6
- 15-4 B versus A 15-7
- 15-5 The vector potential and quantum mechanics 15-8
- 15-6 What is true for statics is false for dynamics 15-14

CHAPTER 16. INDUCED CURRENTS

- 16-1 Motors and generators 16-1
- 16-2 Transformers and inductances 16-4
- 16-3 Forces on induced currents 16-5
- 16-4 Electrical technology 16-8

CHAPTER 17. THE LAWS OF INDUCTION

- 17-1 The physics of induction 17-1
- 17-2 Exceptions to the "flux rule" 17-2
- 17-3 Particle acceleration by an induced electric field; the betatron 17-3
- 17-4 A paradox 17-5
- 17-5 Alternating-current generator 17-6
- 17-6 Mutual inductance 17-9
- 17-7 Self-inductance 17-11
- 17-8 Inductance and magnetic energy 17-12

CHAPTER 18. THE MAXWELL EQUATIONS

- 18-1 Maxwell's equations 18-1
- 18-2 How the new term works 18-3
- 18-3 All of classical physics 18-5
- 18-4 A travelling field 18-5
- 18-5 The speed of light 18-8
- 18-6 Solving Maxwell's equations; the potentials and the wave equation 18-9

CHAPTER 19. THE PRINCIPLE OF LEAST ACTION

- A special lecture—almost verbatim 19-1
- A note added after the lecture 19-14

CHAPTER 20. SOLUTIONS OF MAXWELL'S EQUATIONS IN FREE SPACE

- 20-1 Waves in free space; plane waves 20-1
- 20-2 Three-dimensional waves 20-8
- 20-3 Scientific imagination 20-9
- 20-4 Spherical waves 20-12

CHAPTER 21. SOLUTIONS OF MAXWELL'S EQUATIONS WITH CURRENTS AND CHARGES

- 21-1 Light and electromagnetic waves 21-1
- 21-2 Spherical waves from a point source 21-2
- 21-3 The general solution of Maxwell's equations 21-4
- 21-4 The fields of an oscillating dipole 21-5
- 21-5 The potentials of a moving charge; the general solution of Liénard and Wiechert 21-9
- 21-6 The potentials for a charge moving with constant velocity; the Lorentz formula 21-12

CHAPTER 22. AC CIRCUITS

- 22-1 Impedances 22-1
- 22-2 Generators 22-5
- 22-3 Networks of ideal elements; Kirchhoff's rules 22-7
- 22-4 Equivalent circuits 22-10
- 22-5 Energy 22-11
- 22-6 A ladder network 22-12
- 22-7 Filters 22-14
- 22-8 Other circuit elements 22-16

CHAPTER 23. CAVITY RESONATORS

- 23-1 Real circuit elements 23-1
- 23-2 A capacitor at high frequencies 23-2
- 23-3 A resonant cavity 23-6
- 23-4 Cavity modes 23-9
- 23-5 Cavities and resonant circuits 23-10

CHAPTER 24. WAVEGUIDES

- 24-1 The transmission line 24-1
- 24-2 The rectangular waveguide 24-4
- 24-3 The cutoff frequency 24-6
- 24-4 The speed of the guided waves 24-7
- 24-5 Observing guided waves 24-7
- 24-6 Waveguide plumbing 24-8
- 24-7 Waveguide modes 24-10
- 24-8 Another way of looking at the guided waves 24-10

CHAPTER 25. ELECTRODYNAMICS IN RELATIVISTIC NOTATION

- 25-1 Four-vectors 25-1
- 25-2 The scalar product 25-3
- 25-3 The four-dimensional gradient 25-6
- 25-4 Electrodynamics in four-dimensional notation 25-8
- 25-5 The four-potential of a moving charge 25-9
- 25-6 The invariance of the equations of electrodynamics 25-10

CHAPTER 26. LORENTZ TRANSFORMATIONS OF THE FIELDS

- 26-1 The four-potential of a moving charge 26-1
- 26-2 The fields of a point charge with a constant velocity 26-2
- 26-3 Relativistic transformation of the fields 26-5
- 26-4 The equations of motion in relativistic notation 26-11

CHAPTER 27. FIELD ENERGY AND FIELD MOMENTUM

- 27-1 Local conservation 27-1
- 27-2 Energy conservation and electromagnetism 27-2
- 27-3 Energy density and energy flow in the electromagnetic field 27-3
- 27-4 The ambiguity of the field energy 27-6
- 27-5 Examples of energy flow 27-6
- 27-6 Field momentum 27-9

CHAPTER 28. ELECTROMAGNETIC MASS

- 28-1 The field energy of a point charge 28-1
- 28-2 The field momentum of a moving charge 28-2
- 28-3 Electromagnetic mass 28-3
- 28-4 The force of an electron on itself 28-4
- 28-5 Attempts to modify the Maxwell theory 28-6
- 28-6 The nuclear force field 28-12

CHAPTER 29. THE MOTION OF CHARGES IN ELECTRIC AND MAGNETIC FIELDS

- 29-1 Motion in a uniform electric or magnetic field 29-1
- 29-2 Momentum analysis 29-1
- 29-3 An electrostatic lens 29-2
- 29-4 A magnetic lens 29-3
- 29-5 The electron microscope 29-3
- 29-6 Accelerator guide fields 29-4
- 29-7 Alternating-gradient focusing 29-6
- 29-8 Motion in crossed electric and magnetic fields 29-8

CHAPTER 30. THE INTERNAL GEOMETRY OF CRYSTALS

- 30-1 The internal geometry of crystals 30-1
- 30-2 Chemical bonds in crystals 30-2
- 30-3 The growth of crystals 30-3
- 30-4 Crystal lattices 30-3
- 30-5 Symmetries in two dimensions 30-4
- 30-6 Symmetries in three dimensions 30-7
- 30-7 The strength of metals 30-8
- 30-8 Dislocations and crystal growth 30-9
- 30-9 The Bragg-Nye crystal model 30-10

CHAPTER 31. TENSORS

- 31-1 The tensor of polarizability 31-1
- 31-2 Transforming the tensor components 31-3
- 31-3 The energy ellipsoid 31-3
- 31-4 Other tensors; the tensor of inertia 31-6
- 31-5 The cross product 31-8
- 31-6 The tensor of stress 31-9
- 31-7 Tensors of higher rank 31-11
- 31-8 The four-tensor of electromagnetic momentum 31-12

CHAPTER 32. REFRACTIVE INDEX OF DENSE MATERIALS

- 32-1 Polarization of matter 32-1
- 32-2 Maxwell's equations in a dielectric 32-3
- 32-3 Waves in a dielectric 32-5
- 32-4 The complex index of refraction 32-8
- 32-5 The index of a mixture 32-8
- 32-6 Waves in metals 32-10
- 32-7 Low-frequency and high-frequency approximations; the skin depth and the plasma frequency 32-11

CHAPTER 33. REFLECTION FROM SURFACES

- 33-1 Reflection and refraction of light 33-1
- 33-2 Waves in dense materials 33-2
- 33-3 The boundary conditions 33-4
- 33-4 The reflected and transmitted waves 33-7
- 33-5 Reflection from metals 33-11
- 33-6 Total internal reflection 33-12

CHAPTER 34. THE MAGNETISM OF MATTER

- 34-1 Diamagnetism and paramagnetism 34-1
- 34-2 Magnetic moments and angular momentum 34-3
- 34-3 The precession of atomic magnets 34-4
- 34-4 Diamagnetism 34-5
- 34-5 Larmor's theorem 34-6
- 34-6 Classical physics gives neither diamagnetism nor paramagnetism 34-8
- 34-7 Angular momentum in quantum mechanics 34-8
- 34-8 The magnetic energy of atoms 34-11

CHAPTER 35. PARAMAGNETISM AND MAGNETIC RESONANCE

- 35-1 Quantized magnetic states 35-1
- 35-2 The Stern-Gerlach experiment 35-3
- 35-3 The Rabi molecular-beam method 35-4
- 35-4 The paramagnetism of bulk materials 35-6
- 35-5 Cooling by adiabatic demagnetization 35-9
- 35-6 Nuclear magnetic resonance 35-10

CHAPTER 36. FERROMAGNETISM

- 36-1 Magnetization currents 36-1
- 36-2 The field H 36-5
- 36-3 The magnetization curve 36-6
- 36-4 Iron-core inductances 36-8
- 36-5 Electromagnets 36-9
- 36-6 Spontaneous magnetization 36-11

CHAPTER 37. MAGNETIC MATERIALS

- 37-1 Understanding ferromagnetism 37-1
- 37-2 Thermodynamic properties 37-4
- 37-3 The hysteresis curve 37-5
- 37-4 Ferromagnetic materials 37-10
- 37-5 Extraordinary magnetic materials 37-11

CHAPTER 38. ELASTICITY

- 38-1 Hooke's law 38-1
- 38-2 Uniform strains 38-2
- 38-3 The torsion bar; shear waves 38-5
- 38-4 The bent beam 38-9
- 38-5 Buckling 38-11

CHAPTER 39. ELASTIC MATERIALS

- 39-1 The tensor of strain 39-1
- 39-2 The tensor of elasticity 39-4
- 39-3 The motions in an elastic body 39-6
- 39-4 Nonelastic behavior 39-8
- 39-5 Calculating the elastic constants 39-10

CHAPTER 40. THE FLOW OF DRY WATER

- 40-1 Hydrostatics 40-1
- 40-2 The equations of motion 40-2
- 40-3 Steady flow—Bernoulli's theorem 40-6
- 40-4 Circulation 40-9
- 40-5 Vortex lines 40-10

CHAPTER 41. THE FLOW OF WET WATER

- 41-1 Viscosity 41-1
- 41-2 Viscous flow 41-4
- 41-3 The Reynolds number 41-5
- 41-4 Flow past a circular cylinder 41-7
- 41-5 The limit of zero viscosity 41-9
- 41-6 Couette flow 41-10
