

Welcome to Cyber Aces, Module 2! A firm understanding of network fundamentals is essential to being able to secure a network or attack one. This section provides a broad overview of networking, covering the fundamental concepts needed to understand computer attacks and defenses from a network perspective.

Course Roadmap

In this short section, we'll provide a brief introduction to the Session Layer.

## Session Layer

Sessions are important. The session layer provides flow control to unique connections between applications. The session layer creates and terminates application connections. TCP implements some session layer functionality itself (since it maintains connection states using sequence numbers). Many common TCP/IP protocols implement session layer services as part of the Application layer rather than creating a separate layer. For example, HTTP is often referred to as a "stateless" protocol because it has no concept of a session. HTTP by itself is incapable of identifying a series of requests as part of a single session; it is left to the application developer to use a web application such as PHP or .NET to add session tracking through the use of session cookies. The lack of session layer functionality in the HTTP protocol has led to many compromised web accounts.

Course Roadmap

In this short section, we'll provide a brief introduction to the Presentation Layer.

## Presentation Layer

The Presentation Layer is used by applications to establish a standard way of encoding data. More generally, the Presentation Layer is responsible for providing independence from data formats for Application Layer protocols. For example, encryption of data will often occur as part of the Presentation Layer, as would handling of character encoding (such as UTF-8). MIME (Multipurpose Internet Mail Extensions) is a Presentation Layer protocol that defines the formatting of e-mail messages, particularly multi-format messages and attachments. However, like the Session Layer, most common TCP/IP protocols implement Presentation Layer functions as part of the Application Layer protocol. For example, HTTP can handle character encoding.

## Other Networking Models

The OSI model is not the only networking model; however, it is the one most commonly referred to. Most of the other models lump the Presentation and Session layers into the Application layer. Most often, the OSI layers 5 and 6 are implemented and included in the Application Layer.

Tutorial Complete

This concludes the discussion about Layer 4, the Transport Layer. In the next tutorial we'll discuss the next two layers layer in the OSI model, the Session and Presentation Layers.
